The effective way to Tamper Evidence

The Dividella NeoTOP pack style allows the integration of a number of protection features:

Dividella has been concerned with guaranteeing originality for many years and has solved the problem quite simply by applying a spot of hot-melt glue in the right place.

It is immediately apparent to the user, if the carton has been opened - this application involves virtually no extra machine costs and has no effects at all on the performance of Dividella's packaging machinery.

This solution can be applied for the carton, placing a glue spot on one or all the three flaps of the carton before the fully automated, inline closing. With smart package design, we cannot only apply tamper evidence for the outer carton but for the individual products in the pack as well. As an alternative for the Tamper Evident glue spot we can also apply a tamper evident label inline, after the closing process.

Standard tamper evident closing feature

(The tuck in flap is glued and needs to be broken to open the carton)

(The tuck in flap plus the dust flaps are glued and need to be broken to open the carton)

Swiss perfection with paperboard monomaterial for TopLoading folding boxes

Extended tamper evident closing feature

Individual protection of the products in the carton
(A cover panel is glued over the products. To remove the product, the individual carton tab which protects the product needs to be broken and removed)
